Enabling or disabling User-Mode Hooking (UMH) in Worry-Free Business Security Services (WFBS-SVC)

Product / Version includes:

Worry-Free Business Security Services 6.7 , Worry-Free Business Security Services 6.6

Last updated: 2025/05/08 Solution ID: KA-0008249 Category: Configure , Troubleshoot

Summary

This article serves as an introduction to UMH in WFBS-SVC and provides steps on how to enable or disable User-Mode Hooking.

UMH is an engine in WFBS-SVC that supports the enhanced ransomware solution. It is installed in the Common Client Solution Framework (CCSF) service as a module. It also provides API events for other modules such as Behavior Monitoring, Predictive Machine Learning and others. These modules will make decisions according to the provided API events from the UMH.

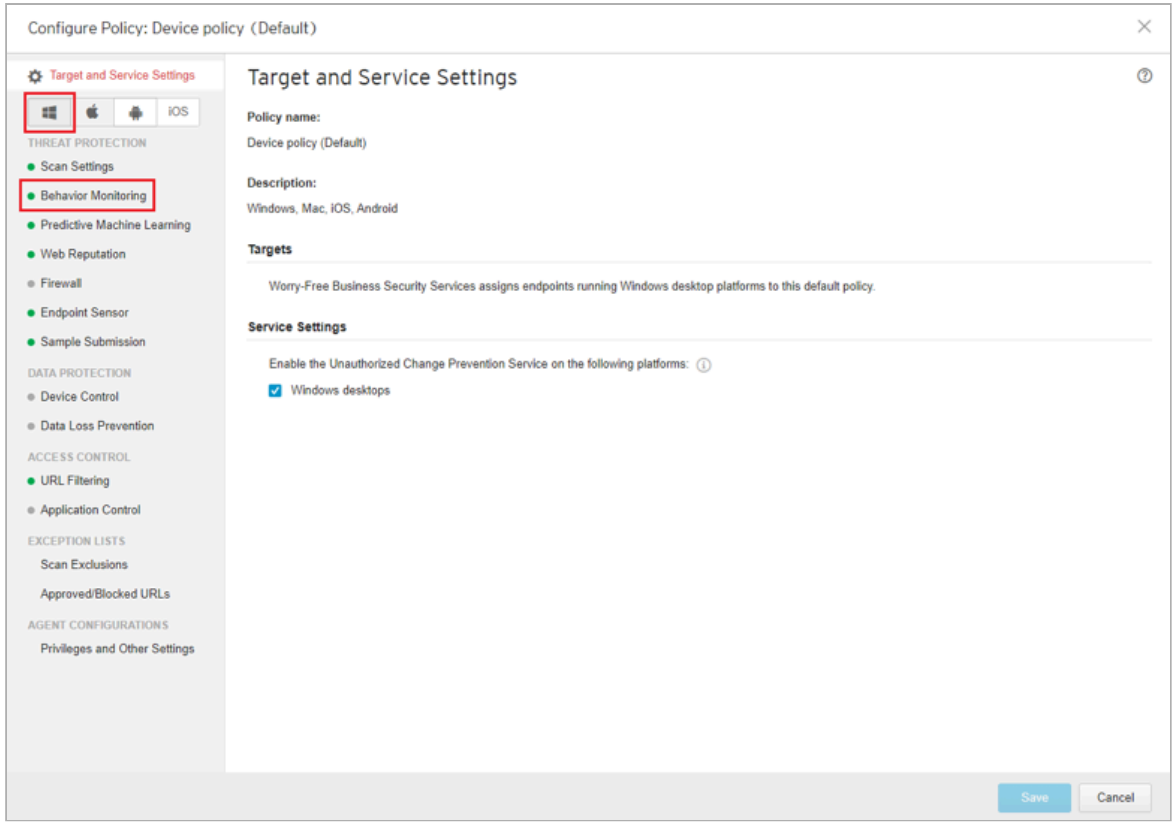
The UMH has been added in WFBS-SVC since version 6.1 with the installation directory:

..\Trend Micro\Client Server Security Agent\CCSF\MODULE\20019\

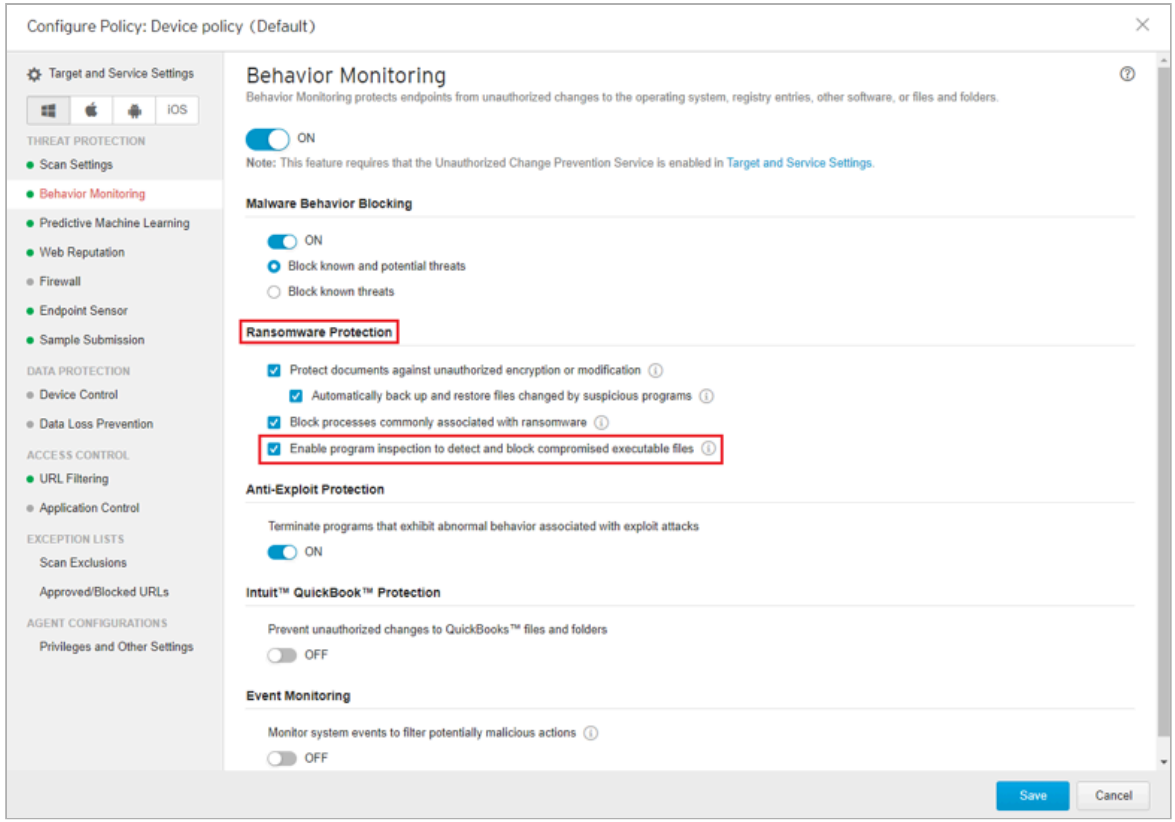
Enable UMH

To enable UMH:

1. Log on to the WFBS-SVC console.
2. Go to the **Configure Policy** page by performing one of the following:
   - Classic Mode: Go to **SECURITY AGENTS** and select a group. Click the **Menu icon** (three vertical dots) > **Configure Policy**.
   - Advanced Mode: Go to **POLICIES** > **Policy Management**. Click **Add** or click an existing policy.
3. Click on the **Windows icon**.
4. Click **Behavior Monitoring**.



5. Under Ransomware Protection, tick **Enable program inspection to detect and block compromised executable files.**



6. Deploy the setting by clicking the **Save** button.

To verify the status of UMH in the WFBS-SVC Agent:

1. Check the following in the WFBS-SVC Agent's registry:
   - x86 platform:

     [HKEY_LOCAL_MACHINE\SOFTWARE\TrendMicro\PC-cillinNTCorp\CurrentVersion\AEGIS]

     "EnableUMH"=dword:00000001

   - x64 platform:

[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\TrendMicro\PC-cillinNTCorp\CurrentVersion\AEGIS]

"EnableUMH"=dword:00000001

2. Check the UMH driver status in the command line:

> sc query tmumh

UMH should be running.

Run **Update Now** on the WFBS-SVC Agent to force the UMH status update.

Disable UMH

UPDATE - IMPORTANT ADVISORY: Trend Micro Endpoint Issue with Microsoft Windows April 2023 Security Updates

Product / Version includes:

Apex One as a Service 2019 , Deep Security 20.0 , Apex One 2019 , Worry-Free Business Security Advanced 10.0 , Worry-Free Business Security Services 6.7 , Cloud One - Endpoint and Workload Security All

Last updated: 2025/05/08 Solution ID: KA-0014352 Category: Troubleshoot

Summary

Updated on 4/24 @ 7:30AM (US Pacific) - UMH Pattern has been updated and is now available on ActiveUpdate.

Trend Micro is aware of a compatibility issue between the User Mode Hooking (UMH) component of several Trend Micro endpoint solutions and the recently released Microsoft Windows Monthly Security Updates (April 2023).

UMH is an engine used in several Trend Micro endpoint and server products that supports the enhanced ransomware solution and is installed as a module. It provides API events for other modules, such as Behavior Monitoring, Predictive Machine Learning, etc. Those modules will make decisions according to the provided API events from UMH.

Trend Micro is aware of a potential issue with customers who applied the recently released Microsoft Windows April 2023 Security Updates.

Please note - the following versions of Windows are NOT impacted:

- *Windows 11 22H2 only - all other versions of Windows 11 are impacted*
- *Windows 10 32-bit versions (all)*
- *Windows 10 1809 (64-bit) only - all other versions of Windows 10 (64-bit) are impacted*
- *Windows Server 2019. 2016, 2012/2012R2*

Impact and Recommendations

Customers who currently use the advanced ransomware protection options of their product are advised to temporarily hold off updating Windows Security Patches until a solution (please see the table below about UMH pattern delivery schedule) is available if possible.

Customers who have already applied the Monthly Security Windows patch on an affected version of Windows may not see any obvious errors such as BSODs, crashes, error messages, or performance impacts - but note that these clients may not have access to advanced protection features such as

enhanced ransomware protection until the new UMH pattern is deployed on April 24th. Core functionality of the products (e.g. malware pattern-based protection) will still function as normal.

Solution Update Schedule

Trend Micro has addressed this issue with an updated UMH pattern, released on April 24, 2023:

Product	Affected Version(s)	Solution
Apex One *Agent OS Reboot is required after receiving the updated pattern version.	2019 (On-prem)	Program Inspection Monitoring Pattern (UMH) **293033**
Apex One as a Service *Agent OS Reboot is required after receiving the updated pattern version.	SaaS	Program Inspection Monitoring Pattern (UMH) **293033**
Deep Security Agent (Including Cloud One - Workload Security) *Agent OS Reboot is required after receiving the updated pattern version.	20.0 / SaaS	Endpoint Sensor Trusted Pattern (UMH) **281149**
Worry-Free Business Security *Agent OS Reboot is required after receiving the updated pattern version.	10.0 SP1	Program Inspection Monitoring Pattern (UMH) **293033**
Worry-Free Business Security Services *Agent OS Reboot is required after receiving the updated pattern	SaaS	Program Inspection Monitoring Pattern (UMH) **293033**

Product	Affected Version(s)	Solution
version.		

Verifying UMH Pattern Version

Trend Micro Apex One (including SaaS) and Worry-Free Business Security (including Services) customers can check their UMH pattern version from either Apex Central (server side) or on the agent itself.

Checking from Apex Central:

Checking from Agent Side: on the client agent right click the agent in taskbar > select *Component Versions* > and verifying the version number under ***Program Inspection Monitoring***
Trend Micro Cloud One - Workload Security and Deep Security customers can verify the version number by logging into the Cloud One or Deep Security Manager (DSM) console > navigate to *Administration* > *Updates* > *Security* > *Patterns* > verifying the version number under ***Endpoint Sensor Trusted Pattern***
