

How to simulate network bandwidth in JMeter?

ON [MAY 29, 2019](#) • ([6 COMMENTS](#))

The rise of the smartphone and easy connectivity to the internet has made access to information easier with most of them accessing websites and web applications from their smartphones.

As a performance engineer, I would like to run my load test on different network speeds like 1 mbps, 4 mpbs, 16 mbps and so on to ensure the app performance.

Why it is needed?

Day by day, mobile traffic over desktop traffic is growing, there is a need to focus on mobile users for performance testing. hence, it is very important to watch how good we are at mobile else it could be lose to business.

Mobile web traffic comprises users with different connection speeds. So, it is very important to perform load testing on mobile apps with different connection speeds.

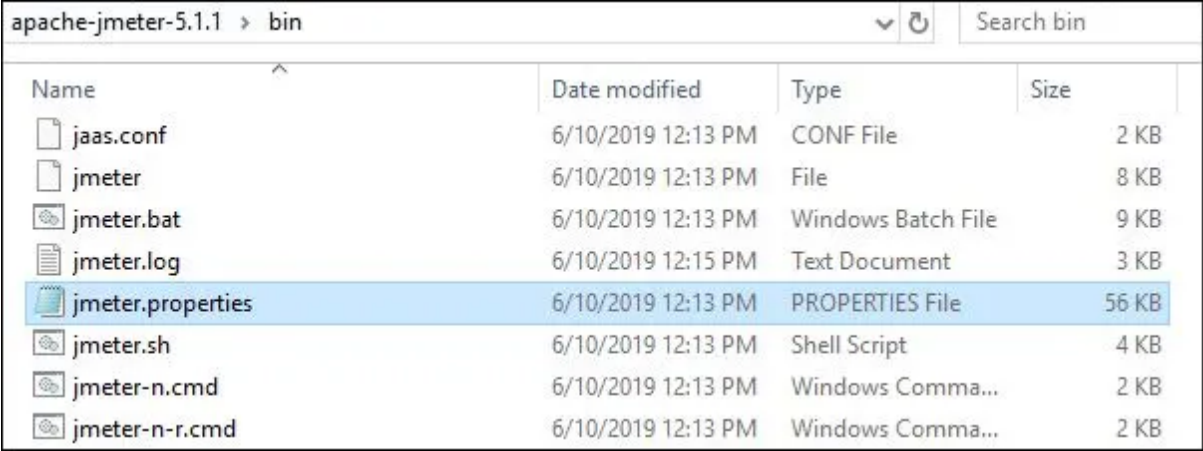

So it's time to Throttle Outgoing Bandwidth to Simulate Different Network Speeds.

By default, Jmeter will send the requests to the target server as fast as it can.

Throttling Outgoing Bandwidth to Simulate Different Network Speeds

JMeter has capability to throttle the outgoing bandwidth in order to have different network speed and to achieve that follow the below mentioned steps:

1. Open *jmeter.properties* file located in /bin folder of JMeter

apache-jmeter-5.1.1 > bin			
Name	Date modified	Type	Size
jaas.conf	6/10/2019 12:13 PM	CONF File	2 KB
jmeter	6/10/2019 12:13 PM	File	8 KB
jmeter.bat	6/10/2019 12:13 PM	Windows Batch File	9 KB
jmeter.log	6/10/2019 12:15 PM	Text Document	3 KB
jmeter.properties	6/10/2019 12:13 PM	PROPERTIES File	56 KB
jmeter.sh	6/10/2019 12:13 PM	Shell Script	4 KB
jmeter-n.cmd	6/10/2019 12:13 PM	Windows Comma...	2 KB
jmeter-n-r.cmd	6/10/2019 12:13 PM	Windows Comma...	2 KB

'jmeter.properties' file

2. Search for keyword "cps"

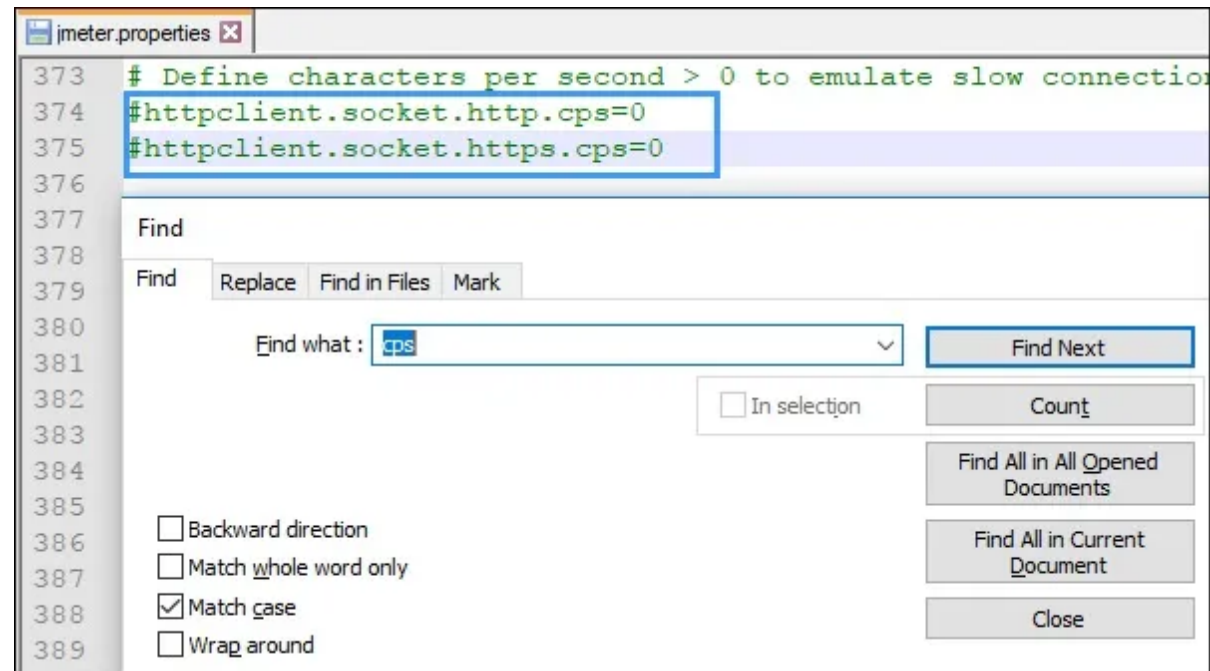

Figure 02: Search with 'cps' keyword

3. If you search using "cps" then you will get two properties:

- httpclient.socket.http.cps=0
- httpclient.socket.https.cps=0

Remove "#" to enable the properties

A screenshot of the 'jmeter.properties' file showing the result of removing the '#' from the previous lines. The lines are now: 373 # Define characters per second > 0 to emulate slow connections, 374 httpclient.socket.http.cps=0, and 375 httpclient.socket.https.cps=0.

```
373 # Define characters per second > 0 to emulate slow connections
374 httpclient.socket.http.cps=0
375 httpclient.socket.https.cps=0
```

Remove '#'

The first property simulates the speed when you use HTTP method (protocol) and the second property is used to simulate the speed for HTTPS method.

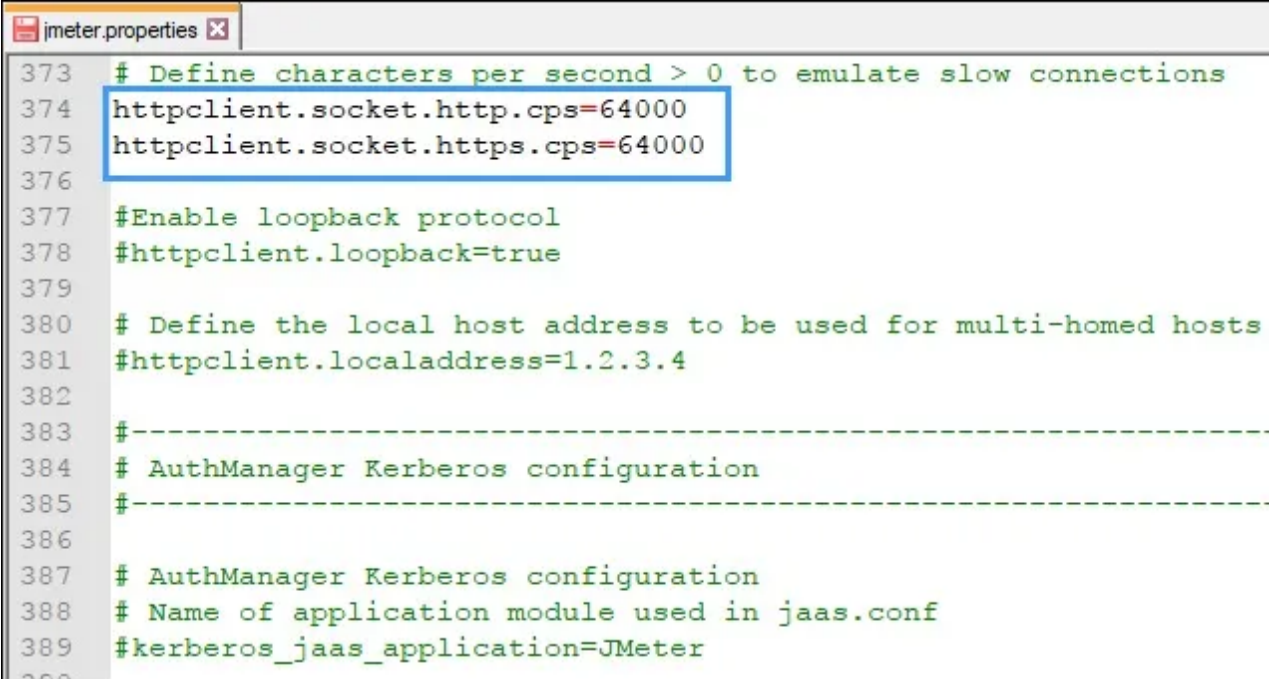

4. Calculate the value using below formula

$$\text{CPS} = \text{RB} * 128$$

where:

CPS = Characters per second

RB = Required Bandwidth that you need to set for the load test. The input value of required bandwidth should be in kbps.

```
jmeter.properties
373 # Define characters per second > 0 to emulate slow connections
374 httpclient.socket.http.cps=64000
375 httpclient.socket.https.cps=64000
376
377 #Enable loopback protocol
378 #httpclient.loopback=true
379
380 # Define the local host address to be used for multi-homed hosts
381 #httpclient.localaddress=1.2.3.4
382
383 #-----
384 # AuthManager Kerberos configuration
385 #-----
386
387 # AuthManager Kerberos configuration
388 # Name of application module used in jaas.conf
389 #kerberos_jaas_application=JMeter
390
```

Calculate and insert the value for CPS (say 64000)

5. Save and close the file. Restart JMeter

Some examples:

Network bandwidth	cps value
Mobile data GPRS : 171 kbit/s	21888
Mobile data EDGE : 384 kbit/s	49152
Mobile data HSPA : 14,4 Mbp/s	1843200
Mobile data HSPA+ : 21 Mbp/s	2688000
Mobile data DC-HSPA+ : 42 Mbps	5376000
Mobile data LTE : 150 Mbp/s	19200000
WIFI 802.11a/g : 54 Mbit/s	6912000
WIFI 802.11n : 600 Mbit/s	76800000
Ethernet LAN ; 10 Mbit/s	1280000
Fast Ethernet : 100 Mbit/s	12800000
Gigabit Ethernet : 1 Gbit/s	128000000
10 Gigabit Ethernet : 10 Gbit/s	1280000000
100 Gigabit Ethernet : 100 Gbit/s	12800000000
WAN modems V.92 modems : 56 kbit/s	7168
ADSL : 8 Mbit/s	1024000
ADSL2 : 12 Mbit/s	1536000
ADSL2+ : 24 Mbit/s	3072000

Calculating cps value

- Example if you want to simulate 1000 kbps speed for the test then
 $\text{cps} = 10000 * 128$
 $\text{cps} = 1280000$

Note: You need to use the HTTPClient3.1 or HTTPClient4 implementation to be able to adjust the JMeter bandwidth. HTTP Request Defaults is the fastest and easiest way to implement all HTTP Request samplers

If you want to set a bandwidth while executing in non GUI mode, below command can be useful .

```
jmeter -JhttpClient.socket.http.cps=<cps value> -n -t <path of .jmx>
```

Points to remember:

- Check the testing environment network bandwidth (where the test to be conducted) before simulating the speed. Because JMeter can only simulate the bandwidth equal to or less than the testing environment network bandwidth.
- Use RB (Required Bandwidth) value in kbps for CPS calculation.
- In a distributed mode, you can set a different bandwidth for each remote engine by specifying your desired 'cps' value in the user.properties file to run the test cases.
